

# Happiness in Open Source

Armin Ronacher

# Me

- Armin Ronacher (*@mitsuhiko*)
- Open Source Person
- Flask, Werkzeug, Jinja, Lektor etc.
- Now working on Sentry

Interrupt Me

Getting There

# The Trigger

- Bought a book by Gregor Lingl: "Python für Kids"
- Stumbled upon the German Python Forum
- The former administrator recommends Linux and with it Ubuntu

# Back in Time

- 2004: Ubuntu was released
  - the first version of Linux I could actually run on my desktop.
- Little bit of PHP Hacking
  - --> [ubuntuusers.de](http://ubuntuusers.de)

# Going with the Flow

- Ubuntu exploded. You could actually see yourself making a “difference”
- got a contribution into ubuntu directly: a simple wallpaper and some translations

# Growing Big

- Founding of the German ubuntu society
- Scaling website to multiple servers
- The politics start

Why did it happen?

# Hermagor

- My Hometown
- Population: 1.500
- People with an interest in technology: few
- Enter the internet

# Next Step: Programming

- Diving into Python development
- learning real programming
- Getting in contact with other Python developers  
(Georg Brandl)

# Learning

- Jinja -> Templates without Django
- Copy pasting code over, trying to improve it
- Learning on IRC from a guy who actually knows parsers.

# Release

- First implementation was crap
- Did not stop me from publishing it though
- What is a license?

# Open?

- You can do whatever you want with it.
- Wrong

# Stumbling Blocks

- Jacob Kaplan–Moss sends me a mail that some of the leftover code from Django in Jinja is missing the License declaration.
- Learning on Licensing

# Communication & Culture

# People

- There is a difference between IRC and RL
- Textual communication can be a problem
- IRC/mail does not transfer emotions
- Different cultures

# Licensing

- Horrible, horrible, horrible, horrible, horrible, horrible, horrible, bad, bad, bad, bad, AAAAaaaargh
- And you can seriously hurt yourself

# Goals

- Often you don't want what others do
- And that might not even be obvious
- Learn to say no

Why do it?

# Why Open Source?

- Fun
- Rewarding
- Networking for shy people
- A common ground

# Learning

- I learn by failing and communicating with others.
- If it wasn't for the open source community I wouldn't be able to find people to talk to.
- Cross language / border

# It pays off

- Learning new things
- Getting introduced to interesting people
- The thrill of working together
- Happiness when you see your stuff being used

# Staying Motivated

# Use It

- You can only build things you use yourself
- Let other's chime in when you stop using it
- Stop using it if you find something better / you need to use something else

# Be More Boring

- Sometimes it's important to stay boring
- Don't get carried away by the latest trends
- Don't overstep the original goals

# Licensing

# BSD or GTFO

- All popular Python modules are MIT/BSD licensed with the occasional LGPL one
- Commercial modules are very, very rare
- GPL libraries ends up being mostly unused

- Why?

# Forced Contributions

- "99% of useful code contributions come from people who are motivated to participate in the project regardless of what the license tells them they have to do." — *Steve Streeting*

# Money: Case Studies

# Making Money

- Selling the software?
  - Libraries vs Applications
- Selling support?
  - BSD/MIT/zlib

# Flask

- Impossible to sell
- However an amazing way to bootstrap a career
- More than possible to sell consulting

# Sentry

- Open Source not Open Core
- Puts us where others cannot be
- Bootstrapped

Thank You
